

To be presented at the American Physical Society,  
Division of Nuclear Physics Fall Meeting  
Research Opportunities for Undergraduates (REU)  
Poster Session  
October, 2000

**Velocities of Neutron-Rich Fragments of  $^{136}\text{Xe}$   
on  $^{nat}\text{C}$  at  $E/A = 30\text{MeV}/u$  collected at 1.36  
T-m and  $\theta_{lab} \geq \theta_{grazing}$ .** A. SICKLES, Gon-

zaga University, T.W. O'DONNELL, University  
of Michigan, and the BIGSOL COLLABORATION  
at the University of Michigan at Ann Arbor and  
NSCL/Michigan State University — We deter-  
mine the fragment yields as a function of veloc-  
ity for multiple-charge-state reaction products of  
30 MeV/u  $^{136}\text{Xe}$  on a thick carbon target, col-  
lected at 1.36 T-m and over an angular range from  
 $0.7^\circ \leq \theta_{lab} \leq 6^\circ$ . We previously reported this run  
to include very neutron-rich nuclei, near the lim-  
its of particle stability (the neutron drip-line), in-  
cluding small count rates of:  $^{80}_{29}\text{Cu}$ ,  $^{76}_{28}\text{Ni}$ ,  $^{68}_{25}\text{Mn}$  and  
 $^{66}_{24}\text{Cr}$ . The experiment took place at the National  
Superconducting Cyclotron Laboratory (NSCL)  
using the U of M at Ann Arbor's superconducting-  
solenoid, BigSol, configured as an isotope spec-  
trometer. To obtain fragment yields as a function  
of velocity, three corrections are made: 1) for en-  
ergy losses in the thick target using the SRIM pro-  
gram, 2) for missing equilibrium-charge-state frac-  
tions using the formulas of Baron et al, and 3) for  
angular acceptance using code developed for Big-  
Sol. The presence of *multiple* charge states at con-  
stant  $B\rho$  ( $\Delta(B\rho)/B\rho \approx 1.6\%$ ) gives each isotope's  
yield at multiple velocities. The present reaction  
is of interest for RNB production as high primary-  
beam fluxes are available at this relatively low en-  
ergy, the BigSol device identified all charge states  
and isotopes, and numerous existing facilities can  
produce such beams. These velocities will next  
be compared with relevant studies in the litera-  
ture and with models to understand and optimize  
the mechanism(s) involved.

Supported in part by US NSF PHY9804869 and  
the NSF REU program.
